

Cisco Application-First Security

Applications are at the center of modern business and your key to creating customer value. Cisco empowers modern business, security teams and application teams have freedom to move faster anywhere, safely with Cisco Application-First Security.

Solution Overview

Cisco's Application-First Security solution enables you to gain visibility into application behavior and increase the effectiveness of security controls by combining capabilities of best-in-class products including Tetration, Stealthwatch Cloud, Duo Beyond and AppDynamics.

Solution: Key Features

- **Closer to application:** Security closer to your application gives you insight and context of your applications so you can easily make intelligent decisions to protect them.
- **Continuous as application changes:** Application-First Security follows your applications as it changes and moves to ensure continuous protections in your digital business.
- **Adaptive to application dependencies:** Security designed to adapt to your application so it can give you granular control and reduce risk by detecting and preventing threats based on overall understanding of your environment.

Benefits

Application-First Security gives you confidence to take your applications anywhere by letting you have:

- **Visibility** – Gain control on both cloud and on-premises environments by getting insights into how cloud applications are communicating across your environment, and see all connected devices on your on-premises network.
- **Compliance** – Automatically generate application-specific policies to meet your organization's security requirements for access to applications and networks.
- **Reduce Risk** – Adaptive security helps you protect apps even with unique dependencies so you can ensure advanced threat prevention and detection.
