

Hey SecOps – Let's simplify your incident response workflow!

Consider our integrated security platform – Cisco SecureX is a built-in experience within our security portfolio that connects with your entire security infrastructure, easing the burden on teams and transforming workflows.

Typically threat response can be a very manual process

Meet Pat from SecOps

5½ hours

When Pat sees a potential data exfiltration alert with a financial analyst's laptop, she currently must operate across **siloed screens** with a **lack of context** when attempting to mitigate the issue.

Automate and complete your workflows with Cisco SecureX

Pat simplifies and accelerates threat response using an automated playbook to finish in **less than half the time**.

Identify

Pat immediately **isolates the laptop** and receives an alert that the IT Helpdesk isolated a different endpoint because of increased memory usage.

Investigate

SecureX unifies visibility and automates enrichment with shared context across multiple control points so Pat can **understand the incident** efficiently. In one view, Pat learns that phishing attempts with an attached **suspicious file** targeted multiple users' endpoints – IT had isolated one of these endpoints.

Remediate

Pat **easily blocks the file** across all threat vectors, blocks access to the domain the file connected to, and notifies IT that the problem is solved.

Pat **updates her security policies** to prevent similar threats in the future.

Communicate

The **problem is resolved** within the IT team's SLA without a big lift on their end, enabling them to focus on innovation and keeping the business running smoothly.
